

Das Grabhaus 1/08 in der Hafennekropole von Ephesos

Ergebnisse der anthropologischen und paläopathologischen Untersuchung kaiserzeitlich-spätantiker Kollektivgräber

by Jan Nováček, Kristina Scheelen-Nováček, Gro Bjornstad, Martin Steskal and Michael Schultz

DESCRIPTION:

During the excavation season in 2008 in Ephesos, a tomb was systematically excavated in the area of the previously little-studied necropolis alongside the harbour channel. The recovery of the many funerals from a total of five graves, which date from the 2nd through to at least the early 5th century AD, enabled the anthropological investigation of more than 100 persons from the Imperial-Late Antique population from a closed find complex for the first time in the history of the excavations at Ephesos. In the interdisciplinary study it was possible to gain founded insights into the demographic make-up and the often difficult living conditions and significant exposure to illness of the people buried in the tomb. The pattern of disease provides evidence of the poor living conditions in the city regarding population density, air quality and hygiene as well as the consequences of poor nutrition. Through comparisons with other populations of a similar date from the Eastern Mediterranean and with written sources, it was possible to situate the population in a geographical and temporal context.
